1. Introduction

1.1 CHIS 2023 Adult Survey Data File

The 2023 California Health Interview Survey (CHIS 2023) Adult Data File consists of individual records obtained from the 2023 data collection period of the CHIS 2023-2024 Adult survey.

The UCLA-Center for Health Policy Research (UCLA-CHPR) is responsible for maintaining consistent standards to protect respondent confidentiality as specified in approved protocols by the UCLA IRB (IRB# 17-000362) and the California Committee for the Protection of Human Subjects (12-05-0176). Organizations that receive CHIS data are required to complete a data use agreement with UCLA-CHPR. The data files listed below must be maintained in accordance with the provisions of the data use agreement between the recipient and UCLA-CHPR. In order to protect respondent confidentiality, UCLA-CHPR maintains the most confidential and sensitive CHIS data only in its files at the Data Access Center (DAC) located at UCLA-CHPR. Researcher access to confidential data, including respondent latitude and longitude, is available by application to the DAC. For more information, please contact dacchpr@ucla.edu. Limited technical assistance is also available from CHIS – please send email to chis@ucla.edu.

1.2 Accompanying Files

In addition to the data file are several accompanying files that facilitate use of the data file; some are not necessary for data analysis but add convenience in utilizing the main data.

a. Data file: ADULT.SAS7BDAT, ADULT.DTA

b. Proc format file: ADULT_PROC_FORMAT.SASc. Format file: ADULT FORMAT.SAS

d. Label file: ADULT LABEL.SAS

e. Imputation flag file: ADULTF.SAS7BDAT, ADULTF.DTA

2. What's New in CHIS 2023

This document describes new and notable design features and data collected in California Health Interview Survey (CHIS) 2023. CHIS data users should review the information below and detailed online documentation before analyzing or reporting CHIS data. For more details on CHIS methods, please visit the CHIS Methodology page.

Oversamples

As with previous cycles, CHIS 2023 saw an oversample in San Diego County thanks to funds provided by the County of San Diego Health and Human Services Agency.

To better target populations not adequately covered by the primary address-based sample (ABS) frame, CHIS 2023 utilized an additional prepaid cell phone frame and targeted 450 completes for this oversample.

To provide researchers in City of Long Beach Health and Human Services with sufficient sample to produce estimates for a variety of health-related topics, CHIS 2023 targeted an oversample of 500 interviews in the City of Long Beach.

To provide Santa Clara County Public Health Department with sufficient samples to produce estimates for a variety of topics, CHIS 2023 oversampled 1,925 respondents from the county.

New and Updated Survey Questions

Survey questions are added, removed, and modified in each two-year cycle of CHIS to meet stakeholders' needs and monitor emerging public health concerns. Questions are removed from the interview to reduce its length and save data collection costs when topics are no longer relevant for public health surveillance, or when sponsor funding is no longer available. For CHIS 2023 approximately 80% of the content continued from CHIS 2021-2022. Occasionally, changes to question wording are made based on methodological evaluations or when user feedback strongly suggests that changes will produce better data. Otherwise, questions are consistent across years to aid in trending and pooling. Reinstated questions were asked in cycles prior to 2021-2022, and again in 2023.

The full list of topics and questionnaires for CHIS 2023 are available on the <u>CHIS Survey</u> <u>Topics and questionnaires page</u>.

New Adult Questionnaire Topics in 2023

- Hemoglobin A1C level under control among diabetics^{1,2}
- Medication to control hypertension, hypertension under control in past 12 months, reduce salt in diet to control hypertension^{1,2}
- High cholesterol in the past 12 months^{1,2}
- Ever had stroke^{1,2}
- COVID-19: Home test vs lab test^{1,2,4}
- COVID-19: Booster vaccination status^{1,2,4}
- COVID-19: Likelihood of getting additional vaccine doses, reason for getting additional vaccine doses^{1,2,4}
- COVID-19: N95, KN95 OR K94 masks, reason for not getting N95, KN95 OR K94 mask^{1,2,4}
- Number of hours of moderate physical activities in a week^{1,2}
- E-cigarette cessation in the past month^{1,2}
- Prescription painkiller use in the past 12 months^{1,2}
- Reasons for using prescription painkiller in the past 12 months²
- Source of prescription painkiller^{2,3}
- Gambling in the past 12 months^{1,2}
- Financial and mental impacts of gambling on behavioral health^{1,2}
- Withheld information about gambling from friends and family^{1,2}
- Received care through telehealth services for mental health or use of alcohol/drugs^{2,3}
- Preference and satisfaction with telehealth services^{2,3}
- Accessed filtered air during wildfire smoke^{1,2}
- Usual provider offered telehealth, mode and type in the past 12 months^{1,2}
- Ease of accessing care and treatment in past 6 months^{1,2}
- Delayed or forgone care in getting prescription medication or needed care^{1,2}
- Reasons for delayed care or delayed prescription^{1,2,3}
- Unintended pregnancy in the past 12 months^{1,2}
- Frequency and place of receiving dental care^{1,2}
- Main reason for not seeing a dentist^{1,2}
- Place of residency one year ago^{1,2,3}
- Housing discrimination experience, main reason for discrimination 1,2,3
- Housing Choice section 8 voucher^{1,2}
- Hate incident experience and witness, type, location, reason for hate incident 1,2,3
- Adverse Childhood Experiences (ACEs) awareness^{1,2}
- Provider discussed strengths, resilience during ACEs assessment^{1,2}
- Reinstated content:

- o Activities of daily living/Disability status^{1,2}
- o Caregiving and its effects on caregivers^{1,2}

New Child Questionnaire Topics in 2023

- Gender identity^{2,3}
- COVID-19: Booster vaccination status^{1,2,4}
- Ease of accessing care and treatment in the past 6 months^{1,2}
- Delayed or forgone care in getting prescription medication or needed care^{1,2}
- Reasons for delayed care or delayed prescription^{1,2,3}

New Adolescent Questionnaire Topics in 2023

- COVID-19: Booster vaccination status^{1,2,4}
- Heroin use in the past 12 months³
- Prescription painkiller use in the past 12 months³
- Methamphetamine use in the past 12 months³
- Satisfaction with mental telehealth care^{2,3}
- Delayed or forgone mental health care, reasons for delayed mental health care^{2,3}
- Delayed or forgone care in getting prescription medication or needed care^{1,2}
- Reasons for delayed care or delayed prescription^{1,2,3}
- Unintended pregnancy in the past 12 months³
- Plans for college, impact of pandemic on college plans 1,2
- Hate incident experience and witness, type, location, reason for hate incident 1,2,3
- Adverse Childhood Experiences (ACEs) awareness^{1,2}
- Provider discussed strengths, resilience during ACEs assessment^{1,2}
- Frequency and place of receiving dental care^{1,2}
- Source of dental health information^{1,2}
- Main reason for not seeing a dentist^{1,2}
- Ease of accessing care and treatment in the past 6 months^{1,2}
- Sexual orientation^{1,2}

Targeting Through Predictive Modeling

CHIS 2023 continued to employ Big Data techniques to help target specific, commonly underrepresented demographic groups. Individual sample flags and geographic density indicators

¹Available in Public Use Files (PUFs)

²Available through AskCHISTM

³Raw data for some variables in the topic area only available for analysis through the Data Access Center (DAC). For more information, visit the <u>DAC webpage</u>.

⁴Preliminary 2023 COVID-19 estimates are available on the Center's 2023 CHIS COVID-19 Preliminary Estimates Dashboard.

of households with certain attributes were applied to predictive models evaluation in CHIS 2023. For more details on the predictive modeling, see CHIS 2023 Methodology Report 1— Sample Design.

Data Collection Methodology Innovations

In order to increase response rates and improve sample yield among African Americans, the third mailing was sent via FedEx to the eligible sampled households in CHIS 2023. Specifically, sampled households that met the criteria of high density African American census block groups (defined as 13% or higher) were randomly assigned to this experiment – to either receive the FedEx or regular First Class envelope. While the FedEx mailing increased overall response, it was not cost-efficient and did not meet our objectives of increasing the proportion of responses coming from Black/African American Californians. As a result, this strategy was discontinued in future CHIS surveys. For more details on the study, see the working paper.

CHIS 2023 also experimentally evaluated the use of sending a second incentive to convert partial interviews to completes. Results show that sending a second incentive significantly improved the completion rate for the *sufficient partials* and had lower costs per complete. Sending a second incentive to the *insufficient partials* also significantly improved the response rate. For more information about this experiment, see the <u>working paper</u>.

Data Collection Timeline

CHIS 2023 data were collected between January 2023 and December 2023.

Approximately 90% of adult interviews were completed over the web with the remainder over the phone.

For small populations or rare conditions and characteristics, pooling two or more single-year datasets may be required to achieve sufficient sample size and statistical stability. Users who need more information about pooling or trending data over time should review the Analyze CHIS Data website or go to the CHIS Data website or go to the CHIS FAQs page. You can also email questions to dacchpr@ucla.edu.

3. CHIS 2023 Sample Design and Methodology

3.1 Overview

A series of five methodology reports is available with more detail about the methods used in CHIS 2023.

- Report 1 Sample Design;
- Report 2 Data Collection Methods;
- Report 3 Data Processing Procedures;
- Report 4 Response Rates; and
- Report 5 Weighting and Variance Estimation.

For further information on CHIS data and the methods used in the survey, visit the California Health Interview Survey Web site at http://www.chis.ucla.edu or contact CHIS at CHIS@ucla.edu or contact CHIS at https://www.chis.ucla.edu or contact CHIS at <a href="ht

The CHIS is a population-based multimode (web and telephone) survey of California's residential, noninstitutionalized population conducted every other year since 2001 and continually beginning in 2011. CHIS is the nation's largest state-level health survey and one of the largest health surveys in the nation. The UCLA Center for Health Policy Research (UCLA-CHPR) conducts CHIS in collaboration with multiple funding sources from public, private, and non-profit organizations. CHIS collects extensive information for all age groups on health status, health conditions, health-related behaviors, health insurance coverage, access to health care services, and other health and health-related issues.

The sample is designed and optimized to meet two objectives:

- 1) Provide estimates for large- and medium-sized counties in the state, and for groups of the smallest counties (based on population size), and
- 2) Provide statewide estimates for California's overall population, its major racial and ethnic groups, as well as several racial and ethnic subgroups.

The CHIS sample is representative of California's non-institutionalized population living in households. CHIS data and results are used extensively by federal and State agencies, local

public health agencies and organizations, advocacy and community organizations, other local agencies, hospitals, community clinics, health plans, foundations, and researchers. These data are used for analyses and publications to assess public health and health care needs, to develop and advocate policies to meet those needs, and to plan and budget health care coverage and services. Many researchers throughout California and the nation use CHIS data files to further their understanding of a wide range of health related issues (visit UCLA-CHPR's publication page at https://healthpolicy.ucla.edu/our-work/publications for examples of CHIS studies).

3.2 Sample Additions and Data Collection Methodology Updates

Starting in 2021, the CHIS added a prepaid cell phone sample to the primary ABS sample. A second innovation was altering the envelope for the initial mailing to have a window that would allow the incentive to be seen. The CHIS research team deemed these changes necessary to improve representation of California's diverse population and improve response rates.

For CHIS 2023, respondents in the ABS sample are invited to either complete the survey online or call in to be interviewed by a member of the SSRS interviewing staff. Respondents receive an initial invitation letter with a \$2.00 pre-incentive. This is followed by a reminder postcard, a standard letter, and a final postcard. Where addresses can be matched to a listed telephone number, the nonresponding households are also called up to six times to attempt to complete an interview before the sampled household is considered to be a resolved nonresponse. In addition to the ABS sample frame, CHIS 2023 utilized a supplemental listed prepaid cell phone sample to meet targets in certain stratum.

The prepaid cell phone oversample followed the same dialing protocol of up to six dials before retiring the sample. In addition, the sampled phone number was screened for respondents who were either aged 18 to 24, Hispanic, African American, or would take the survey in one of the non-English languages offered for CHIS 2023.

In addition to the prepaid cell phone oversample, CHIS 2023 included two geographic oversamples:

- 1) An oversample of households from 11 ZIP codes in the City of Long Beach.
- 2) An oversample of households in Santa Clara County.

In order to provide CHIS data users with more complete and up-to-date information to facilitate analyses of CHIS data, additional information on how to use the CHIS sampling weights, including sample statistical code, is available at https://healthpolicy.ucla.edu/our-work/california-health-interview-survey-chis/access-chis-data/resources.

Additional documentation on constructing the CHIS sampling weights is available in the CHIS 2023 Methodology Series: Report 5—Weighting and Variance Estimation posted at https://healthpolicy.ucla.edu/our-work/california-health-interview-survey-chis/chis-design-and-methods/chis-methodology-reports-repository. Other helpful information for understanding the CHIS sample design and data collection processing can be found in the four other methodology reports for each CHIS cycle and year.

3.3 Sample Design Objectives

The CHIS 2023 sample was designed to meet the two sampling objectives discussed above: (1) provide estimates for adults in most counties and in groups of counties with small populations; and (2) provide estimates for California's overall population, major racial and ethnic groups, and for several smaller racial and ethnic subgroups.

To achieve these objectives, CHIS 2023 continued to employ an address-based sample design. For the ABS sample, the 58 counties in the state were grouped into 44 primary geographic sampling strata, and 14 sub-strata were created within the two most populous counties in the state (Los Angeles and San Diego). The same geographic stratification of the state has been used since CHIS 2005. The Los Angeles County stratum included eight sub-strata for Service Planning Areas, and the San Diego County stratum included six sub-strata for Health Service Districts. Most of the strata (39 of 44) consisted of a single county with no sub-strata (see counties 3-41 in Table 1-1). Three multi-county strata comprised the 17 remaining counties (see counties 42-44 in Table 1-1). A sufficient number of adult interviews were allocated to each stratum and sub-stratum to support the first sample design objective for the two-year cycle—to provide health estimates for adults at the local level.

As with CHIS 2021-2022, the address-based sample in CHIS 2023 was stratified into different strata that had higher incidences of individuals with targeted characteristics. For CHIS 2023, these strata were based on predictive models that employed Big Data techniques to identify household attributes such as demographics, spoken languages, and even attitudinal

metrics that are correlated with important respondent characteristics. The process begins by taking prior data and building models with those data, and then scoring future samples with the outcomes of those models. In addition to evaluating the predictive models, for CHIS 2023 we also investigated the utility of individual sample flags provided by MSG database information, including the surname flags, child indicator variables, and resident age information as well as PDB block-group characteristics including the density of households with African American residents and households with limited English proficiency.

For CHIS 2023, the following strata were created¹:

- 1) Vietnamese
- 2) Korean
- 3) Likely Asian-language Interview
- 4) Likely Spanish-language interview
- 5) Hispanic
- 6) Other high-density non-English
- 7) Other Asian
- 8) High density African American
- 9) HH with children
- 10) Other 65+
- 11) Residual Match
- 12) Residual No match

This stratification scheme was designed to make use of the most effective predictive variables to target key demographic subgroups in an efficient way that minimizes the impact of the disproportionate sampling on the design effect. Those models that were not sufficiently predictive to add value were excluded. It should be noted that this stratification includes two additional strata: 1) sample records for which none of the variables or models predicted any attribute, but for which auxiliary data could be matched to the address ("Residual - Match" sample) and sample for which no Big Data was found ("Residual - No match" sample). The final

¹ The Santa Clara oversample employs a slightly different strata, please refer to Methodology Report 1 – Sample Design for additional details.

step in utilizing the models is to develop sampling fractions by which modeled households will be selected. The final sample fractions balanced the need to increase the frequency of the lowest incidence groups, while accounting for subgroup differences in response propensity and minimizing disproportionate weighting whenever possible.

Within each geographic and modeled stratum combination, residential addresses were selected, and within each household, one adult (age 18 and over) respondent was randomly selected. In those households with adolescents (ages 12-17) and/or children (under age 12), one adolescent and one child of the selected parent/guardian were randomly selected. The adolescent was interviewed directly via CATI or Web. The child interview was completed by the selected adult respondent who was the parent or guardian.

Table 1-1. California county and county group strata used in the CHIS 2023 sample design

•	, ,	1 0
1. Los Angeles	7. Alameda	27. Shasta
1.1 Antelope Valley	8. Sacramento	28. Yolo
1.2 San Fernando Valley	9. Contra Costa	29. El Dorado

6. Riverside	26. Butte	Mariposa, Mono, Tuolumne

Source: UCLA Center for Health Policy Research, 2023 California Health Interview Survey.

In addition to the ABS sample frame, CHIS 2023 utilized a supplemental listed prepaid cellphone sample to meet targets in twelve geographic stratum that were underperforming in completion rate. Listed prepaid cell phones were sampled from the following 12 geographic strata:

- 1. Los Angeles
 - a. SPA1
 - b. SPA5
- 2. San Diego
 - a. Central
- 3. Santa Clara
- 4. Sacramento
- 5. Contra Costa
- 6. Ventura
- 7. San Joaquin
- 8. Sonoma
- 9. Santa Cruz
- 10. Merced
- 11. Mendocino
- 12. San Benito

To better target populations not adequately covered under the ABS frame in CHIS 2023, we utilized a prepaid cell phone oversample of 450 completes to obtain additional in-language interviews, Hispanic and African American samples, and young adults. Prepaid cell phone numbers are associated with cell phones that are "pay-as-you-go" and do not require a contract. Prepaid numbers are more likely to be used by Hispanics, people with lower education and lower income, and other related groups that are often underrepresented in general population samples (e.g., the uninsured).

The CHIS ABS sample and the prepaid oversample were of sufficient size to accomplish the second objective, i.e., to produce statistically stable estimates for small population groups such as racial/ethnic subgroups, children, adolescents, etc.

3.4 Data Collection

To capture the rich diversity of the California population, interviews were conducted in six languages: English, Spanish, Chinese (Mandarin and Cantonese dialect), Vietnamese, Korean, and Tagalog. These languages were chosen based on analysis of ACS 2021 5-year data to identify the languages that would cover the largest number of Californians in the CHIS sample that either did not speak English or did not speak English well enough to otherwise participate.

SSRS collaborated with UCLA on the methodology and collected data for CHIS 2023, under contract with the UCLA Center for Health Policy Research. SSRS is an independent research firm that specializes in innovative methodologies, optimized sample designs, and reaching low-incidence populations. For all sampled households, one randomly selected adult in each sampled household either completed an on-line survey or was interviewed by telephone by an SSRS interviewer. In addition, the study sampled one adolescent and one child if they were present in the household and the sampled adult was their parent or legal guardian. Thus, up to three interviews could have been completed in each household. The child interview was moved in 2019 to take place immediately after Section A of the adult survey and the rostering of the household. The adolescent survey took place either immediately after the adult with phone interviews or in a separate session online.

Table 1-2 shows the number of completed adult, child, and adolescent interviews in CHIS 2023 by mode of interview. Note that these figures were accurate as of data collection completion for 2023 and may differ slightly from numbers in the data files due to data cleaning and edits. Sample sizes to compare against data files you are using are found online at https://healthpolicy.ucla.edu/our-work/california-health-interview-survey-chis/chis-design-and-methods/chis-design.

Table 1-2. Number of completed interviews by mode of interview and instrument

Adult	Child	Adolescent

Totals ¹	23,697	3,650	1,045
Completes by Web	21,101	3,370	989
Completes by phone	2,596	280	56

Source: UCLA Center for Health Policy Research, 2023 California Health Interview Survey.

¹ Includes interviews meeting the criteria of sufficient partial.

Interviews in all languages were administered using SSRS's computer-assisted web interviewing and computer-assisted telephone interviewing (CAWI/CATI) system. As expected, the CATI interviews were longer in duration. The duration of the CATI interviews averaged almost 68 minutes, 20 minutes, and 25 minutes for the adult, child, and adolescent interviews, respectively; the duration of the CAWI interviews averaged around 45 minutes, 13 minutes, and 18 minutes for the adult, child, and adolescent interviews, respectively. Interviews in non-English languages typically took longer to complete across both modes: the non-English CATI interviews had an average length of about 76 minutes, 22 minutes, and 25 minutes for the adult, child, and adolescent interviews respectively; the non-English CAWI interviews had an average length of about 54 minutes, 16 minutes, and 18 minutes for the adult, child, and adolescent interviews, respectively.

Nearly 8 percent of the adult interviews were completed in a language other than English, as were about 12 percent of all child (parent proxy) interviews and 2 percent of all adolescent interviews.

Table 1-3 shows the major topic areas for each of the three survey instruments (adult, child, and adolescent). If questions were asked in only one year of survey implementation, the specific year is indicated in the table.

3.5 Response Rates

The overall response rates for CHIS 2023 are composites of the screener completion rate (i.e., success in introducing the survey to a household and randomly selecting an adult to be interviewed) and the extended interview completion rate (i.e., success in getting one or more selected persons to complete the extended interview). For CHIS 2023, the overall household response rate was 8.5 percent (the product of the screener response rate of 11.8 percent and the extended interview response rate at the household level of 72.1 percent). CHIS uses the RR4 type response rate described in the AAPOR (The American Association for Public Opinion Research), 2016 guidelines (see more detailed in *CHIS 2023 Methodology Series: Report 4 – Response Rates*).

The extended interview response rate for the ABS sample varied across the adult (64.7 percent), child (82.2 percent) and adolescent (27.9 percent) interviews. The adolescent rate includes the process of obtaining permission from a parent or guardian.

Multiplying these rates by the screener response rates used in the household rates above gives an overall response rate for each type of interview for 2023 (see Table 1-4b).

Table 1-4a. CHIS response rates - Conditional

Type of Sample	Screener ¹	Household (given screened) ¹	Adult (given screened) ¹	Child (given screened & eligibility) ¹	Adolescent (given screened & permission) ¹
Overall	11.8%	72.1%	64.7%	82.2%	27.9%

Table 1-4b. CHIS response rates - Unconditional

Type of Sample	Screener ¹	Household (given screened) ¹	Adult (given screened) ¹	Child (given screened & eligibility) ¹	Adolescent (given screened & permission) ¹
Overall	11.8%	8.5%	7.7%	9.7%	3.3%

Source: UCLA Center for Health Policy Research, 2023 California Health Interview Survey.

¹The prepaid cell, Long Beach, and Santa Clara oversamples are not included in these rates.

¹ The prepaid cell, Long Beach, and Santa Clara oversamples are not included in these rates.

After all follow-up attempts to complete the full questionnaire were exhausted, adults who completed at least approximately 80 percent of the questionnaire (i.e., through Section K which covers employment, income, poverty status, and food security), were counted as "sufficient partial complete." At least some responses in the employment and income series, or public program eligibility and food insecurity series were missing from those cases that did not complete the entire interview. They were imputed to enhance the analytic utility of the data.

Proxy interviews were conducted for any adult who was unable to complete the extended adult interview for themselves, in order to avoid biases for health estimates of chronically ill or handicapped people. Eligible selected persons were re-contacted and offered a proxy option. In CHIS 2023, either a spouse/partner or adult child completed a proxy interview for sixteen adults. A reduced questionnaire, with questions identified as appropriate for a proxy respondent, was administered.

Further information about CHIS data quality and nonresponse bias is available at https://healthpolicy.ucla.edu/our-work/california-health-interview-survey-chis/chis-design-and-methods/chis-design/chis-2019-2020-redesign.

3.6 Weighting the Sample

To produce population estimates from CHIS data, weights were applied to the sample data to compensate for the probability of selection and a variety of other factors, some directly resulting from the design and administration of the survey. The sample was weighted to represent the noninstitutionalized population for each sampling stratum and statewide. The weighting procedures used for CHIS 2023 accomplish the following objectives:

- Compensate for differential probabilities of selection for addresses (households) and persons within household;
- Reduce biases occurring because non-respondents may have different characteristics than respondents;

- Adjust, to the extent possible, for under coverage in the sampling frame and in the conduct of the survey; and
- Reduce the variance of the estimates by using auxiliary information

As part of the weighting process, a household weight was created for all households that completed the screener interview. This household weight is the product of the "base weight" (the inverse of the probability of selection of the address) and several adjustment factors. The household weight was used to compute a person-level weight, which includes adjustments for the within-household sampling of persons and for nonresponse. The final step was to adjust the person-level weight using weight calibration, a procedure that forced the CHIS weights to sum to estimated population control totals simultaneously from an independent data source (see below).

Population control totals of the number of persons by age, race, and sex at the stratum level for CHIS 2023 were primarily created from the California Department of Finance's (DOF) 2023 Population Estimates, and associated population projections. The procedure used several dimensions, which are combinations of demographic variables (age, sex, race, and ethnicity), geographic variables (county, Service Planning Area) in Los Angeles County, and Health and Human Services Agency (HHSA) region in San Diego County), and education. One limitation of using DOF data is that it includes about 2.4 percent of the population of California who live in "group quarters" (i.e., persons living with nine or more unrelated persons and includes, for example nursing homes, prisons, dormitories, etc.). These persons were excluded from the CHIS target population and, as a result, the number of persons living in group quarters was estimated and removed from the DOF control totals prior to calibration.

The DOF control totals used to create the CHIS 2023 weights are based on 2020 Census counts. Please pay close attention when comparing estimates using CHIS 2023 data with estimates using data from CHIS cycles before 2023. The most accurate California population figures are available when the U.S. Census Bureau conducts the decennial census. For periods between each census, population-based surveys like CHIS must use population projections based on the decennial count. For example, population control totals for CHIS 2009 were based on 2009 DOF estimates and projections, which were based on Census 2000 counts with adjustments for demographic

changes within the state between 2000 and 2009. These estimates become less accurate and more dependent on the models underlying the adjustments over time. Using the most recent Census population count information to create control totals for weighting produces the most statistically accurate population estimates for the current cycle, but it may produce unexpected increases or decreases in some survey estimates when comparing survey cycles that use 2010 Census-based information and 2020 Census-based information.

3.7 Imputation Methods

Missing values in the CHIS data files were replaced through imputation for nearly every variable. This was a substantial task designed to enhance the analytic utility of the files. SSRS imputed missing values for those variables used in the weighting process and UCLA-CHPR staff imputed values for nearly every other variable.

Three different imputation procedures were used by SSRS to fill in missing responses for items essential for weighting the data. The first imputation technique was a completely random selection from the observed distribution of respondents. This method was used only for a few variables when the percentage of the items missing was very small. The second technique was hotdeck imputation. The hot-deck approach is one of the most used methods for assigning values for missing responses. Using a hot deck, a value reported by a respondent for a specific item was assigned or donated to a "similar" person who did not respond to that item. The characteristics defining "similar" vary for different variables. To carry out hot-deck imputation, the respondents who answered a survey item formed a pool of donors, while the item non-respondents formed a group of recipients. A recipient was matched to the subset pool of donors based on household and individual characteristics. A value for the recipient was then randomly imputed from one of the donors in the pool. SSRS used hot-deck imputation to impute the same items that have been imputed in all CHIS cycles since 2003 (i.e., race, ethnicity, home ownership, and education). The last technique was external data assignment. This method was used for geocoding variables such as strata, Los Angeles SPA, San Diego HSSA region, and zipcode where the respondent provided inconsistent information. For such cases geocoding information was used for imputation.

UCLA-CHPR imputed missing values for nearly every variable in the data files other than those imputed by SSRS and some sensitive variables for which nonresponse had its own meaning.

Overall, item nonresponse rates in CHIS 2023 were low, with most variables missing valid responses for less than 1% of the sample. Questions that go to fewer overall respondents or that ask about more sensitive topics can have higher nonresponse.

The imputation process conducted by UCLA-CHPR started with data editing, sometimes referred to as logical or relational imputation: for any missing value, a valid replacement value was sought based on known values of other variables of the same respondent or other sample(s) from the same household. For the remaining missing values, model-based hot-deck imputation without donor replacement was used. This method replaced a missing value for one respondent using a valid response from another respondent with similar characteristics as defined by a generalized linear model with a set of control variables (predictors). The link function of the model corresponded to the nature of the variable being imputed (e.g. linear regression for continues variables, logistic regression for binary variables, etc.). Donors and recipients were grouped based on their predicted values from the model.

Control variables (predictors) used in the model to form donor pools for hot-decking always included standard measures of demographic and socioeconomic characteristics, as well as geographic region; however, the full set of control variables varies depending on which variable is being imputed. Most imputation models included additional characteristics, such as health status or access to care, which are used to improve the quality of the donor-recipient match.

Among the standard list of control variables, gender, age, race/ethnicity, educational attainment and region of California were imputed by SSRS. UCLA-CHPR began their imputation process by imputing household income so that this characteristic was available for the imputation of other variables. Sometimes CHIS collects bracketed information about the range in which the respondent's value falls when the respondent will not or cannot report an exact amount. Household income, for example, was imputed using the hot-deck method within ranges defined by a set of auxiliary variables such as bracketed income range and/or poverty level.

The imputation order of the other variables generally followed the questionnaire. After all imputation procedures were complete, every step in the data quality control process was performed

once again to ensure consistency between the imputed and non-imputed values on a case-by-case basis.

4. Sample Code for Analysis and Pooling of CHIS Data

As previously noted, sample code to assist with analyses and pooling of CHIS data is available on the CHIS website at https://healthpolicy.ucla.edu/our-work/california-health-interview-survey-chis/access-chis-data/resources.

5. Restricted Variables

The following geographic variables are not located in any released files, but may be accessible upon request and IRB approval (UCLA & CPHS). These variables are restricted due to their identifiable nature.

VARIABLE	LABEL	NOTE
LATITUDE	LATITUDE	GEOGRAPHIC LONGITUDE OF RESIDENCE. USED FOR MAPPING.
LONGIT	LONGITUDE	GEOGRAPHIC LONGITUDE OF RESIDENCE. USED FOR MAPPING.
	CENSUS BLOCK	SMALLEST CENSUS DELINEATION AVAILABLE TO MERGE WITH
	INCLUDING	CENSUS DATA; USED FOR MULTILEVEL MODELING,
CBLK	CENSUS TRACT	NEIGHBORHOOD ANALYSIS.

Teen and child restricted variables:

VARIABLE	LABEL	NOTE
	SCHOOL CENSUS	
	TRACT	SMALLEST CENSUS DELINEATION AVAILABLE TO MERGE WITH
	INCLUDING	CENSUS DATA; USED FOR MULTILEVEL MODELING, SCHOOL
SCH_BLK	BLOCK	NEIGHBORHOOD ANALYSIS.
	STATE SCHOOL	
SCH_CDS	ID NUMBER	
	SCHOOL	
SCH_LAT	LATITUDE	GEOGRAPHIC LONGITUDE OF SCHOOL. USED FOR MAPPING.
	SCHOOL	
SCH_LON	LONGITUDE	GEOGRAPHIC LONGITUDE OF SCHOOL. USED FOR MAPPING.

6. CHIS Data Dictionary

How to Use the Data Dictionary

This Data Dictionary describes the variables in the CHIS 2023 data file. The index of the data dictionary lists variables first in alphabetical order and then in the order they were administered in the survey questionnaire. Please note that identical variable names appearing in the CHIS 2001, CHIS 2003, CHIS 2005, CHIS 2007, CHIS 2009, CHIS 2011-12, CHIS 2013-2014, CHIS 2015-16, CHIS 2017-18, CHIS 2019-20, CHIS 2021-2022, and CHIS 2023 data files does not guarantee identical question wording, response categories or universe; please consult the questionnaires and data dictionaries to assess comparability across cycles. A printable version of the questionnaire can be found on the California Health Interview Survey web site at http://healthpolicy.ucla.edu/our-work/california-health-interview-survey-chis/chis-design-and-methods/survey-topics-and-questionnaires.

The data dictionary contains the following fields:

- **VARNAME:** The names of the variables.
- **LABEL:** A description (or label) of the variable which is the same as what is included in the label file described in Section 1.2.
- **VALUE:** Response categories and their sample distributions of categorical variables. The following negative values are used for all variables:
- -1: INAPPLICABLE.
- **-2:** PROXY SKIPPED.
- -5: CHILD/HOUSEHOLD INFORMATION NOT COLLECTED FOR TEEN AND CHILD INTERVIEWS.
- **-7:** REFUSED.
- -8: DON'T KNOW.
- **-9:** NOT ASCERTAINED.
- **MEAN STATISTICS:** Sample distributions of continuous variables.
- **UNIVERSE:** The scope of eligible respondents for the corresponding item. For some questions and variables, certain respondents become ineligible due to skip patterns or other restrictions (e.g., age and sex).
- INPUT VAR: Source variables used to construct the one in the VARNAME field.
- **NOTES**: Additional information about the variable.

Navigation

Users can also navigate between data dictionary sections by clicking on the section listings on the next page.
